Some students have reported problems with WINSCP outside the lab so here are some alternative instructions if you prefer to use FireFTP from home.

Connection using FireFTP in FireFox

If you don't have FireFTP added to Firefox open the URL below with *FireFox*

<https://addons.mozilla.org/en-US/firefox/search/?q=fireftp> .

Download/install FireFTP and restart FireFox.

Open FireFTP (Tools → FireFTP) and set up a connection as below.
The important settings have been highlighted in red

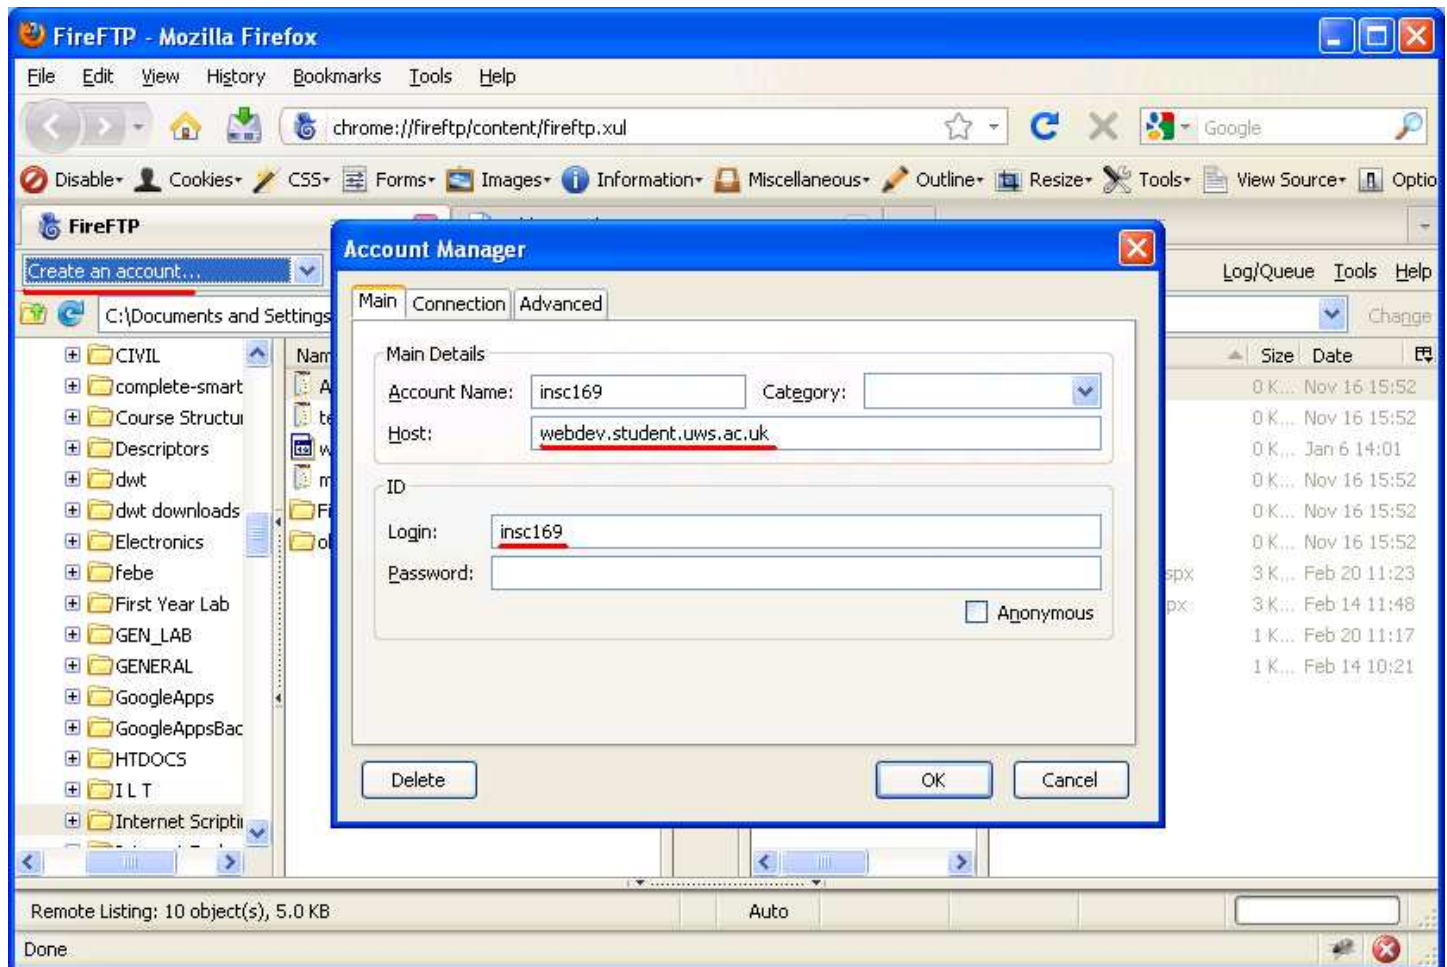

Create an account → Account Manager – Main Tab

Account Name → your choice

Host → webdev.student.uws.ac.uk

Login → inscXXX (your internet scripting user account name)

Password → leave blank on a shared or lab machine

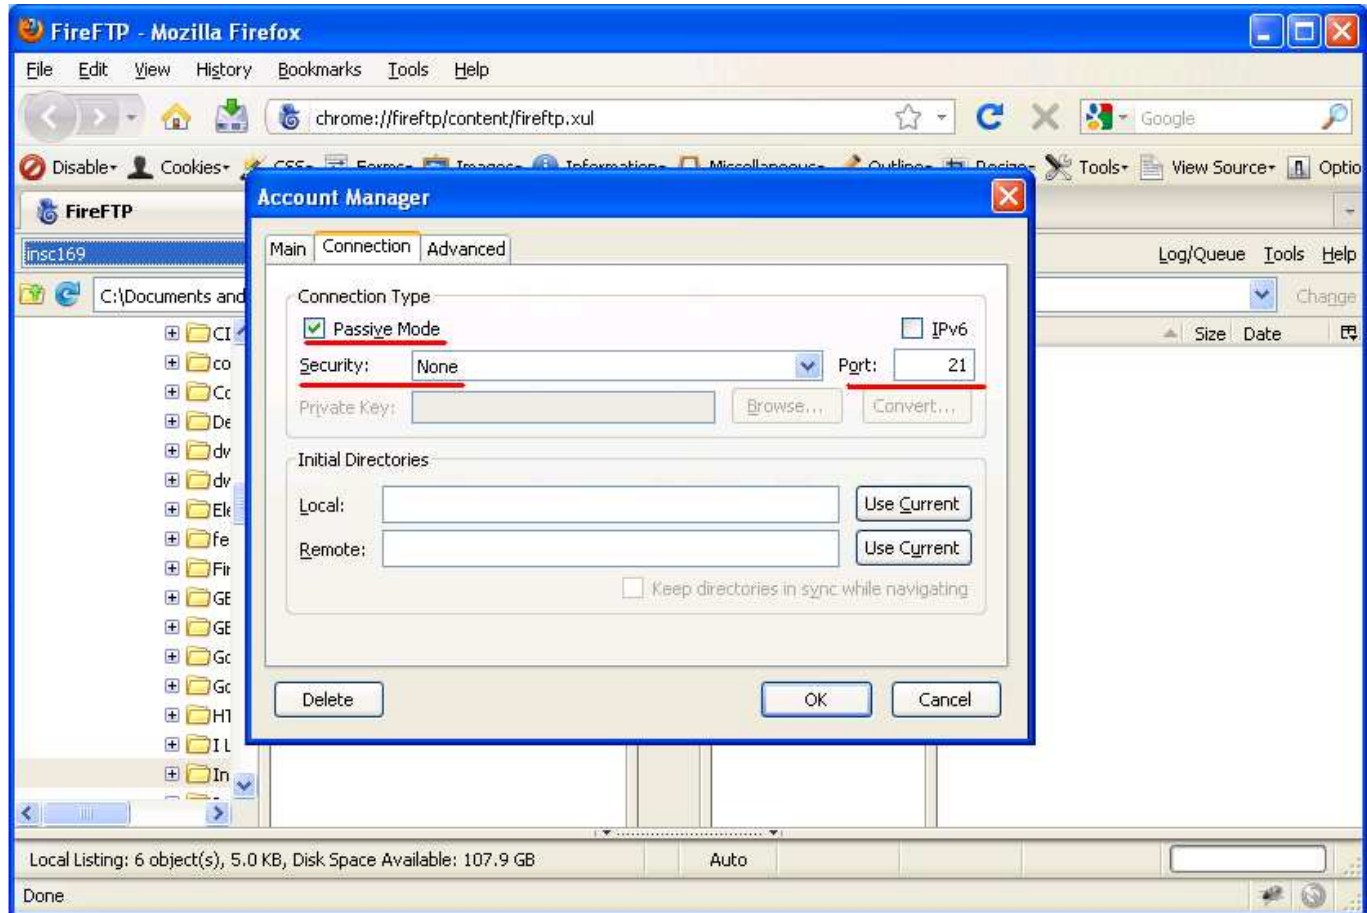

The same username & password are used to view your web pages in a browser.

Account Manager – Connection Tab

Passive Mode → Tick to select

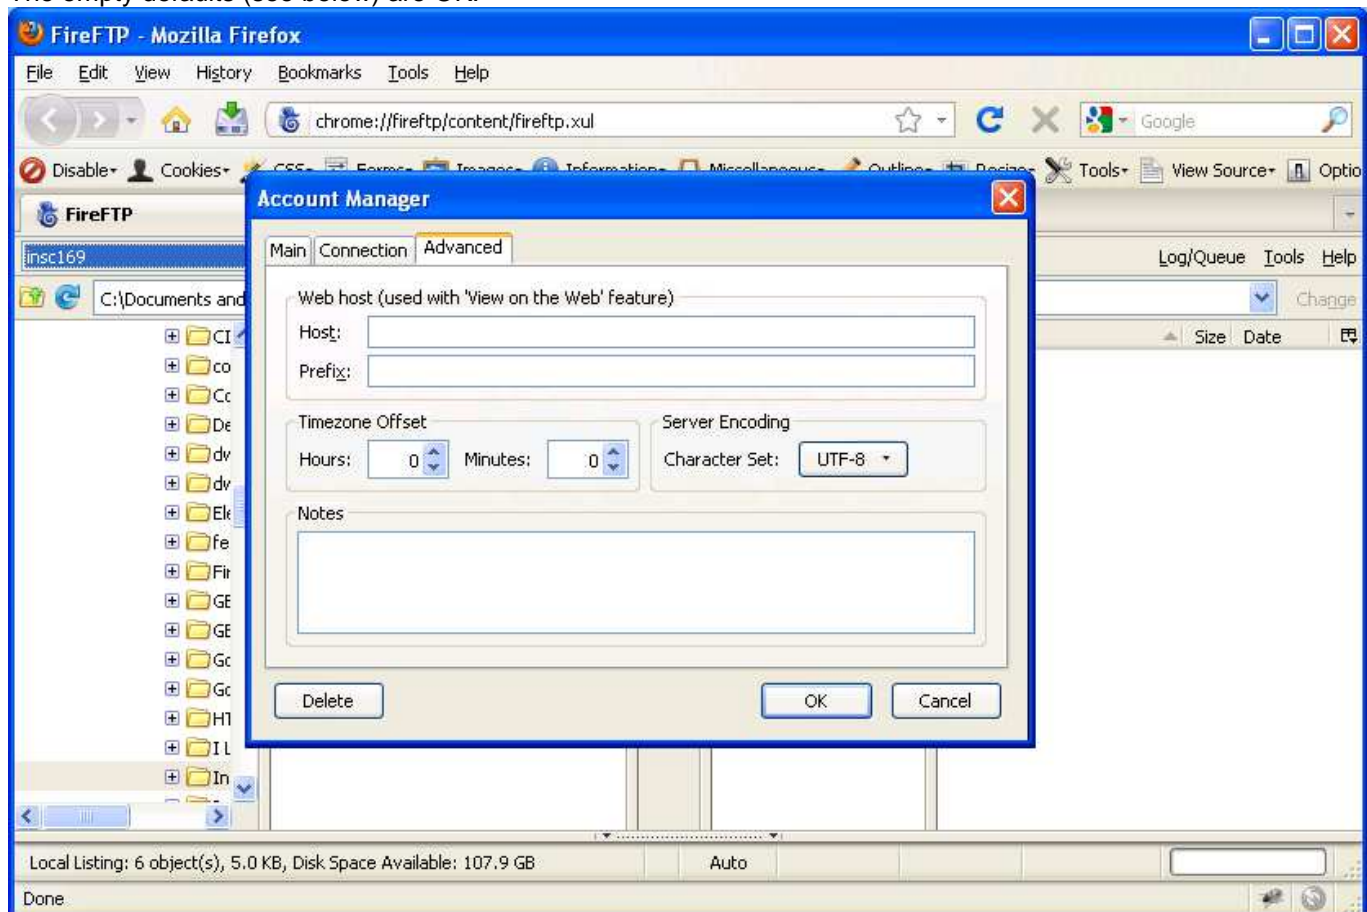

Security → None

Port → 21

Account Manager – Advanced Tab

The empty defaults (see below) are OK.

That's it!
